Upscale developers of high-end residences are installing **GAS** cooling systems because they offer many benefits that young professional buyers are looking for:

- *Single Phase Power up to 25 Tons*
- *Low Operating Costs*
- *L.E.D. readout for ease of servicing*
- *No CFC's/HCFC's (no reclaiming)*
- *Design flexibility with chilled water*
- *24% reduction in misc.electric usage*
- *Variable speed condenser fan*
- *Power Burner*
- *Long Equipment Life*

The Servel, 4-ton, **GAS** chiller sits aside this two-story, three-bedroom, 1800 square foot colonial in rural Connecticut.

“We had temperatures in the 90’s for several weeks, the first year we moved into our new, first home. It was one of the hottest summers on record. Looking back now I’m really glad we had the air conditioning installed when we did. My wife was pregnant with our first child, and it would have been a very unpleasant first summer in our new home if we didn’t install our **GAS** chiller then,” states the owner.

With a **GAS** chiller, you can easily zone to meet various comfort levels and the unit requires only single-phase power so you don’t have the additional cost of 3-phase-power hook up. The equipment is built to last too; there are many chillers still operating that were installed over 30 years ago.

Because **GAS** cooling is environmentally friendly and promotes a “green environment”, today’s young professionals favor it.
